BP.L — relative valuation, 30 October 2026

PROVISIONAL: QA block C did not fully pass. Comparable valuation is BLOCKED. The regression calculation below is conditional, not a verified fair-value conclusion or investment recommendation.

1. Scope, quote and decision-use limits

BP p.l.c., London ordinary share GB0007980591. GBP6.274 closing quote (627.4GBX); 15,450million rounded current shares. Quote x shares gives GBP96,933.3million, 0.0275% below vendor GBP96,960million. Fiscal inputs are FY2025, not TTM; all prices use30October2026. USD financials convert through cached USD1.1172 and GBP0.8338 per EUR. Each US ADS is six ordinary shares; this report values one London ordinary.

The approved relative_only route excludes DCF and a stage4 recommendation. The limited UK/GBP cache top-up and reduced input checkpoint were pushed separately. GBP default-free rate4.8287% uses the latest returned BoE28October observation;29/30October were unavailable. This rate is background cache coverage, not an input to the published multiple equations.

2. Comparable method: no compliant valuation released

The initial researched pool contains24candidates, excluding BP. Europe-first scoring and ordered World, size and Tier3 relaxations are logged. Numeric rankings alone are not peer qualification. No complete panel is certified: ownership/restructuring/history and several common-equity/NCI definitions remain unverified, and associates/other claims are not harmonized across peers. The final qualified CSV therefore has0peers, not a padded10. Below8 blocks valuation; all11required multiple rows remain with unavailable reasons. No peer-implied share price, dispersion interval or peer upside is asserted.

A matching Damodaran Europe industry-median benchmark is not registered, so its statistic/period comparability and >50% gap test cannot be completed. An aggregate ratio is not relabelled a median. IEUR29October holdings are only a dated membership proxy. Human Spot_check remains pending. To unblock: supply/register the verified matching industry-median dataset, then finish uniform claim bridges and all hard-filter/identity evidence. Unqualified candidate statistics are audit diagnostics only.

3. Published-regression calculation (conditional)

EUROPE January2026 EV/EBITDA equation predicts 18.072785x; published R-squared26.2%. BP actual regression-base EV/EBITDA is 6.192718x; actual/predicted minus1 = -65.73%. The inverse bridge gives GBP23.5868 per ordinary share versus GBP6.274 (+275.95%). This is an arithmetic conditional output, NOT evidence of mispricing or an actionable target.

Equation:18.15 +35.25 x revenue growth -0.11 x DFR -0.12 x effective tax +2.29 x ROIC. DFR = gross debt/(gross debt+current common equity market cap). ROIC = EBIT(1-tax)/(common book equity+debt-cash). The user-approved as_published_note policy passes DFR and tax as decimals.

Approved fundamental substitution: EPS growth0 and revenue-growth proxy0, not sourced5Y analyst consensus. Observed3Y analyst EPS12.99% and sales2.45% are not substituted silently for5Y. Closing-common ROE is 0.101827%; payout 93.666667x is retained, capped only in growth retention. Original beta-0.25 is replaced by sourced cash-corrected unlevered beta0.41, relevered with24.71% source marginal tax to 0.582382. Effective tax is 83.281694%.

Alternatives: PE prediction 758.921321x, R-squared20.1%, conditional GBP1.9797; not selected because FY common NI is only USD54million and payout is extreme. PBV prediction -22.600011x, R-squared42.3%, is negative and not valued. Higher published R-squared does not rescue an economically invalid prediction; no clipping or invented PS equation.

4. Bridge, normalization and sensitivity

Base FY2025 USDmillion inputs: vendor EBITDA30,168, EBIT14,446, common NI54, common book53,031; debt72,529 includes leases14,571; cash36,556; NCI20,948 includes hybrid15,955 (deducted ONCE). Separate preference carrying-equity claim proxy21 is deducted. Regression EV retains associates; its inverse is multiple x EBITDA -debt -NCI -preference +cash. Do not add the JV13,400 or associate7,325 carrying values to this regression inverse. These carrying amounts would require uniform numerator/denominator reconciliation for the peer method.

Issuer reported EBIT12,642 differs from vendor standardization by14.27%; issuer EBITDA proxy12,642+17,822=30,464 differs from vendor EBITDA by0.98% using issuer as denominator. Revenue189,335 minus production taxes1,698 reconciles vendor187,637. Material impairments6,037 exceed10% of reported EBIT. A separate issuer impairment-addback sensitivity has EBIT18,679 and EBITDA36,501; it is not an unexplained base replacement. Underlying replacement-cost parent

NI55+1,017+6,413=7,485 (common sensitivity7,484) is not IFRS NI, an analyst forecast or a harmonized peer basis.

Mechanical sensitivities at the unchanged base multiple: EBITDA -20% mechanical stress: GBP18.3193; base vendor EBITDA: GBP23.5868; EBITDA +20% mechanical stress: GBP28.8543; issuer PBIT + DDA parallel: GBP23.8452; issuer impairment-addback parallel: GBP29.1157; full FY decommissioning provision as incremental debt-like claim: GBP22.9949. Provision-as-debt is a conservative incremental claim stress, not the base; it may double-count operating economics. Neither these scenarios nor peer quartiles are confidence intervals.

Unit sensitivity: percentage-point DFR/tax policy predicts 4.276716x and conditional GBP3.4818. This materially different result is not selected; decimal base follows explicit approval, but sector-median plausibility remains an open QA failure. Analyst-set illustrative Brent low/base/high USD55/70/85 per barrel and Henry Hub USD2.5/4/5.5 per MMBtu are assumptions only. No sourced commodity-to-earnings calibration exists, so they are not mapped to invented EBITDA forecasts or weighted values.

5. QA, provenance and limitations

QA block C executed ONCE. Six live workbook predictions (three equations, both unit policies) were recalculated by LibreOffice Calc and match the Python library within1e-9. No own-estimation sample, LINEST, adjusted R-squared, SEy, p-values, A/B/C, D1-D10 or residual classification is fabricated. Three reproducibly random numeric candidate EV checks are not a certified selected-peer Spot_check. Overall QA remains provisional because the benchmark, qualified peer panel and uniform bridges are missing.

Equations are302days old at valuation date, market-wide rather than industry fits, with low explanatory power and no published residual dispersion. Fundamental growth differs from the file analyst5Y definition; payout, effective tax and near-zero reported NI represent severe extrapolation. Damodaran EV/invested-capital perimeter is undocumented. FY bridge claims are stale relative to the quote date; carrying claim proxies are not market values. The large conditional EV result is unsupported by a qualified peer comparison. No blending, recommendation or precision claim is warranted.
